INTRODUCTION

A classification of surgical procedures was included in the Provisional Classification of Diseases, Injuries and Causes of Death issued by the Medical Research Council in 1944. The acceleration of development of hospital statistics in this country in the last few years has revealed that there was a need among hospitals for a classification of surgical operations which could be used in conjunction with the International Statistical Classification of Diseases, Injuries and Causes of Death (W.H.O. 1948). During 1950 a draft code was accordingly prepared by the General Register Office, based broadly on the list of surgical operations included in "The Basic Diagnostic Manual of Diseases and Injuries, 1949" prepared for use by the Medical Services of the Armed Forces of the United States of America. Individual categories included within the sections of the Code were derived from lists prepared for the purpose by specialists in the various groups of operations and from existing lists. The first draft of the Classification, consisting of the List of Three-digit Categories and the Tabular List of Inclusion Terms, was approved by the Registrar General's Advisory Committee on Medical Nomenclature and Statistics in November, 1950, for trial in a limited number of hospitals. A comprehensive Index was issued in November, 1951. Appendix I, containing a Classification of Radiotherapeutic Procedures, was prepared in 1952. Appendix II, Classification of Anaesthetic Procedures, completes the volume. Copies of the draft classification were also sent to the Royal Colleges of Surgeons of London and Edinburgh and to the Royal College of Obstetricians and Gynaecologists for their opinion and to a number of national statistical offices. It was also tried out in the General Register Office during 1952 for coding operations recorded in the Hospital In-patient Enquiry. The present version of the classification embodies the suggestions received from outside bodies and from specialists who had assisted in the original compilation. The Index has also been revised to a certain extent; the revision is not yet complete but, as there has been a demand for the Code, which has compelled early reprinting, it has been decided to publish it as it stands. The General Register Office would welcome suggestions from hospitals and others using the index on terms which might usefully be included in it or omitted.

Soon after this Code was first prepared, international interest was aroused in the subject of a code of operations and anaesthetic procedures, and this country was one of several asked by the World Health Organization to study the subject and thus assist in the ultimate development of a code suitable for

international use in conjunction with the International Statistical Classification of Diseases, Injuries and Causes of Death. The World Health Organization has noted with interest the progress so far in the preparation of this code, and wide use of the Code at this stage will assist still further in the decision as to the best form for an international code.

The Operations Code is referred to the two axes of *site* and *operative procedure* and employs a three-figure classification. It is divided into 15 main sections according to the broad anatomical site of the operation or the surgical specialty, to each of which is allotted a series of numbers. Each main section is further divided into a number of groups and subgroups, as necessary, to give more precision to the site; e.g.,

I Neurosurgery

Brain and cerebral meninges (001-019)

Spinal cord and spinal meninges (020-029)

Peripheral nerves and sympathetic system (030-049)

The order of arrangement of the three-figure categories within each group is broadly: incisions, drainage, local excisions, complete excisions, plastic operations, other operations. The use of eponyms has, with few exceptions, been avoided, but these are provided for in the Index. The code has the advantage of being built on a uniform pattern throughout, and also, being based on a decimal system which allows of ready expansion by additional digits to meet special local needs, it is suitable for international use.

Radiotherapeutic procedures (Appendix I) are coded with a 5-figure classification as follows:-

Digits 1 and 2	Anatomical site
" 3	Timing in relation to operation
" 4	Radiotherapeutic agent
" 5	Method and accessory surgical or other procedures.

In classifying anaesthetic procedures only two approaches to the problem appear to be practicable, either to use a very detailed classification, such as the 14 figure code used in some hospitals in this country, e.g. Cardiff, and in the United States of America, or else to use a very simple code of 5 or 6 digits. Since the code is intended for producing statistics on a national scale, it must be one which could be easily used in every hospital, and hence has been limited to 5 figures as follows:-

Digit 1	Premedication
" 2-4	Three anaesthetic agents
" 5	Techniques

The Operations Classification can be used to record the operation itself, the anaesthetic procedure, and, if necessary, (10170)

a radiotherapeutic procedure, by using 13 digits; a further digit is needed for recording whether or not a blood transfusion was given. It is fully appreciated that such limited codes would be inappropriate for the records of specialised departments. The aim has been to produce short codes which will serve to record certain basic facts and which can be expanded as required.

The Registrar General is indebted to his Advisory Committee on Medical Nomenclature and Statistics and to a number of specialists for their valuable assistance in formulating the Classification, and also to the hospitals who have tested its practical usefulness.

TABULAR LIST OF INCLUSIONS

The Tabular List makes special uses of parentheses and colons. In addition to the ordinary use of parentheses to enclose alternative wordings or explanatory phrases, they are used to enclose supplementary words which may be either present or absent in the statement of the nature of the operation without affecting the code number to which it is assigned. Words followed by a colon (:) are not complete terms, but must have one or other of the understated modifiers to make them assignable to the given category. "N.O.S." is an abbreviation for "not otherwise specified" and is virtually the equivalent of "unspecified" and "unqualified".

"N.E.C." stands for "not elsewhere classifiable"; and an operation should be assigned to a category thus denoted only when there is insufficient information about the nature of the operation to assign it to a more specific category.
